Notebook Overview

Walkthrough of 12
main sections in
Jupyter Notebook

04

Model Evaluation (Results)

Performance
comparison across
models

05

Key Churn Drivers
(Insights)

Main features
influencing customer
churn

06

Business Impact
(Financial Analysis)

Revenue impact of
churn reduction
scenarios

07

Recommended Actions

Prioritized
strategies for
retention

08

Conclusion & Takeaways

Final summary and key
lessons learned

01 Project Background & Objectives

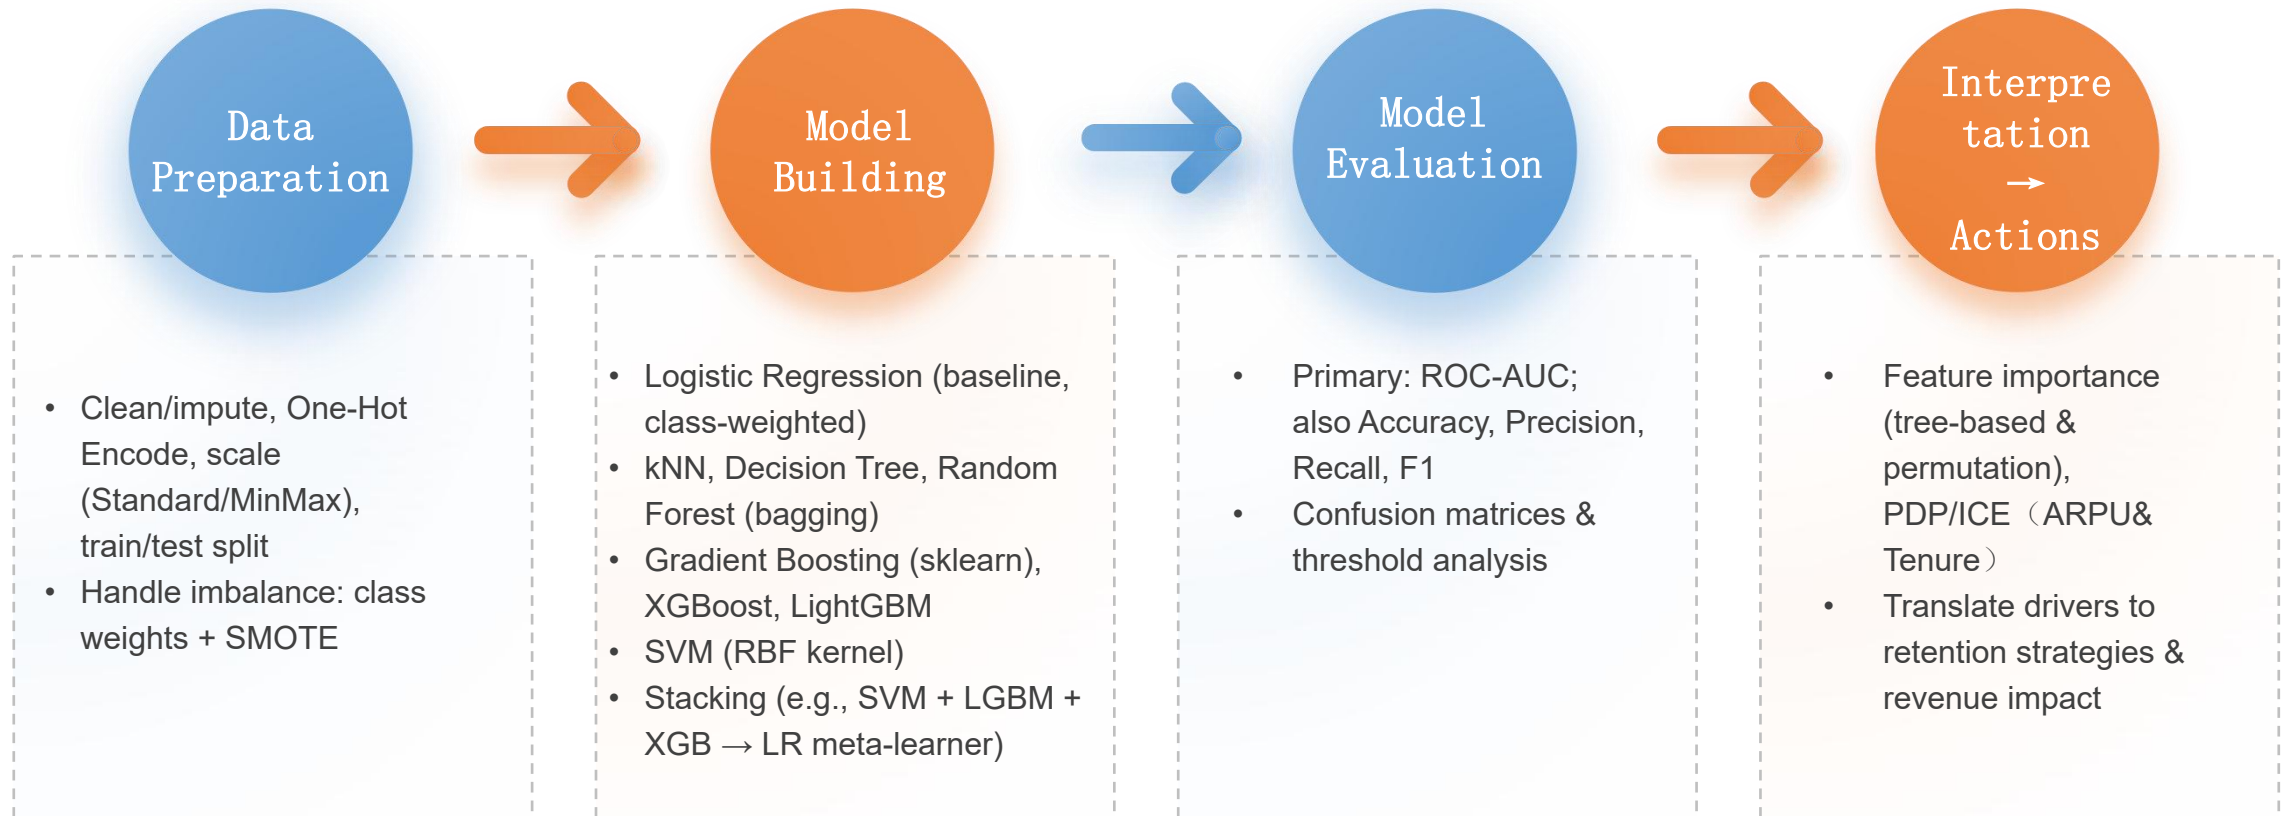

Background:

- Customer churn is a critical problem for subscription businesses, leading to significant revenue loss.
- So the key question of this project is: Can we predict which customers are likely to churn?

Objectives:

- Explore customer patterns through **exploratory data analysis**.
 - Build predictive **machine learning models**.
 - Identify the **key drivers of churn**.
 - Translate the results into actionable **business strategies**.
- 

02 Methodology & Workflow

03-07 Instructions

Sections 03–07 are not shown here in slides.
Instead, they are demonstrated directly in the
Jupyter Notebook,

08 Conclusion & Takeaways

Model performance

- Model performance close: most models **AUC \approx 0.84–0.85**
- Robust baselines: Logistic Regression & Random Forest stable and interpretable
- Future potential: XGBoost / LightGBM promising with richer features & larger data

Key churn drivers

- Key churn drivers: ARPU \uparrow , Short tenure, Month-to-month contracts, Electronic check payment, Internet Service, Monthly / Total Charges

Business impact:

- Business impact: Reducing churn **25%** \rightarrow **20% \approx +\$293K** annual revenue

Takeaway

- Value is not just model accuracy, but turning insights into actionable retention strategies

Future work: enrich feature engineering, try deep learning methods, and validate on real business data for deployment.
